SALT SPRAY TESTING

Salt spray testing closely simulates the conditions vehicles face during harsh winters in locations that use highly corrosive roadway treatment chemicals. These chemicals may keep roadways safe, but they are devastating to vehicle undercarriages and metal parts.

Individual steel plates were cleaned and then treated with Protection First Class and a "Top Lanolin-based Competitor" separately, according to the each products directions for use. The plates were then exposed to a continuous, direct spray of 5% salt water solution. This is by far the harshest testing Protection First Class has been subjected to and it is clear to see that Protection First Class continues to prevent rust and corrosion even when competing products fail.

PROTECTION FIRST CLASS TOP LANOLIN COMPETITOR
